SOUND
What is sound?

- Click on the image below to find out.

Sounds are made when objects vibrate and the vibrations travel to enter your ear.

You hear these vibrations as sounds.
Sound is all around us

We cannot always see the vibrations that make sound, but we might be able to feel them.

- Place your hand on your chest whilst talking, what can you feel?
- Does it feel different when you talk in a silly voice?

Why do you think it feels different?
The vibrations feel different when you talk in different voices because the pitch is changing.

- The pitch is how high or low a sound is.

The pitch of a sound depends on how fast or slow the vibrations are.

- When you talk in a low pitched voice, the vibrations are slow.

- When you talk in a high pitched voice, the vibrations are fast.
We often put lots of different sounds together to make music.

Try and make the same sounds as these instruments. You can use your body and objects that are in the classroom.
Music and sound have the ability to make us feel a certain way

- What is a sound that makes you feel scared?
- What is a sound that makes you feel happy?
Listen to the clips below, record on your sheet how they make.
